Come and Farm.

[From the American Stock Journal.] Buying and Stocking a Farm

With Cattle. The profit to be derived from the occupation of land depends so much on the command of the requisite capital, that the most important consideration for a young beginner is, to be well advised on his essential point, and to be assured that he posesses sufficient means to turn every acre to the best account, always bearing in mind, that a comparatively small farm, with sufficient capital, will be more beneficial than another of larger extent without the power of employing it to advantage. Assuming it therefore as certain, that the young farmer is pro-vided with this indispensable requisite, we shall proceed to give a few general hints on the buying and stocking his farm; and introduce, under the respective accounts of rearing and breeding the different species, such faults as will materially assist him in

the course of his labors. The first object of attention is, to to resell before the cattle are in a fit state for the market, and, consequent.

It is the controlling one hand, he will incur a diminution in the controlling one hand, he will be controlling one hand, he will be controlling one hand, he will be controlling one hand.

this circumstance will claim the attention of the breeder as he advances in

m a lean or fat state, the farmer should ly structures which occupy space and decline when deprived of it. How gamzations, but to consolidate and Celebrated Blood Cleanser or Panacea on no account procure them out of necessitate trouble; but it is urged much more must an infant, in its first extend their influence - Western richer or better grounds than those that it is expensive to erect such struggle for life, be dependent upon Rural. into which he intends to turn them. buildings. To Prevent Cracks in Walls, Walls of dwelling houses crack rom various causes, always attributaole to some defect in the materials mployed in making the mortar, or in the frame work and lathing which feceives the mortar. When the mortar is made of sand among which there is a large proportion of aluminus ma terial, the walls are liable to crack as the mortar dries; whereas, if the mortar is made of clean sharp sand, mingled with just enough good lime to fill the interstices between the grains of sand, the morter will not shrink in drying, unless it is laid on very dry lath on the side of a brick wall in hot weather. It is a common practice among professional builders, to riddle the sandy loam, which is bequently half c'ay, that is dug up cellar of a dwelling-house, and employ it in preparing mortar for plastering in lieu of clean sand, If walls made second year. There are about twenof such mortar do not crack, they are
